```

SyncXML prepares, validates and exports structured data for the SES.HOSPEDAJES workflow. It does not replace human review or the controller's legal judgement.

Table of contents

An ordered guide to transform a booking Excel into validated XML ready for the SES.HOSPEDAJES operational workflow.

01	What is Anclora SyncXML	3
02	Before you start	5
03	Document workflow	6
04	Review and smart validation	8
05	XML generation, review and download	10
06	SES services and test pre-check-in	12
07	Dashboard and operational history	14
08	Privacy, security and good practices	16
09	Frequently asked questions	17
10	Quick glossary	18

1. What is Anclora SyncXML

Import screen

Anclora SyncXML is a premium application that transforms a booking Excel file into a reviewable, validated XML prepared for the SES.HOSPEDAJES operational workflow.

The application is designed for sensitive guest data with a minimisation approach: first review, then correct, and only then generate or download the XML.

What it is for

Need	How SyncXML helps
Import bookings	Reads the Excel file and detects booking, property, payment and travellers.
Validate data	Marks errors and warnings before XML generation.
Correct fields	Lets you complete SES-required fields through guided review.
Generate XML	Creates one XML per booking with a normalised filename and timestamp.
Review before sending	Shows a visual view and the technical XML.
Prepare SES	Includes local validation, simulation and pre-production controls.
Test pre-check-in	Generates temporary test links to complete traveller data.

What it does not do

- It does not replace the official SES portal or services.
- It should not be used as the complete legal registry if SES is the authoritative source.
- It does not store ID card or passport images.
- It does not send to production without configuration and pre-production evidence.

2. Before you start

Before using SyncXML, define the operational scope.

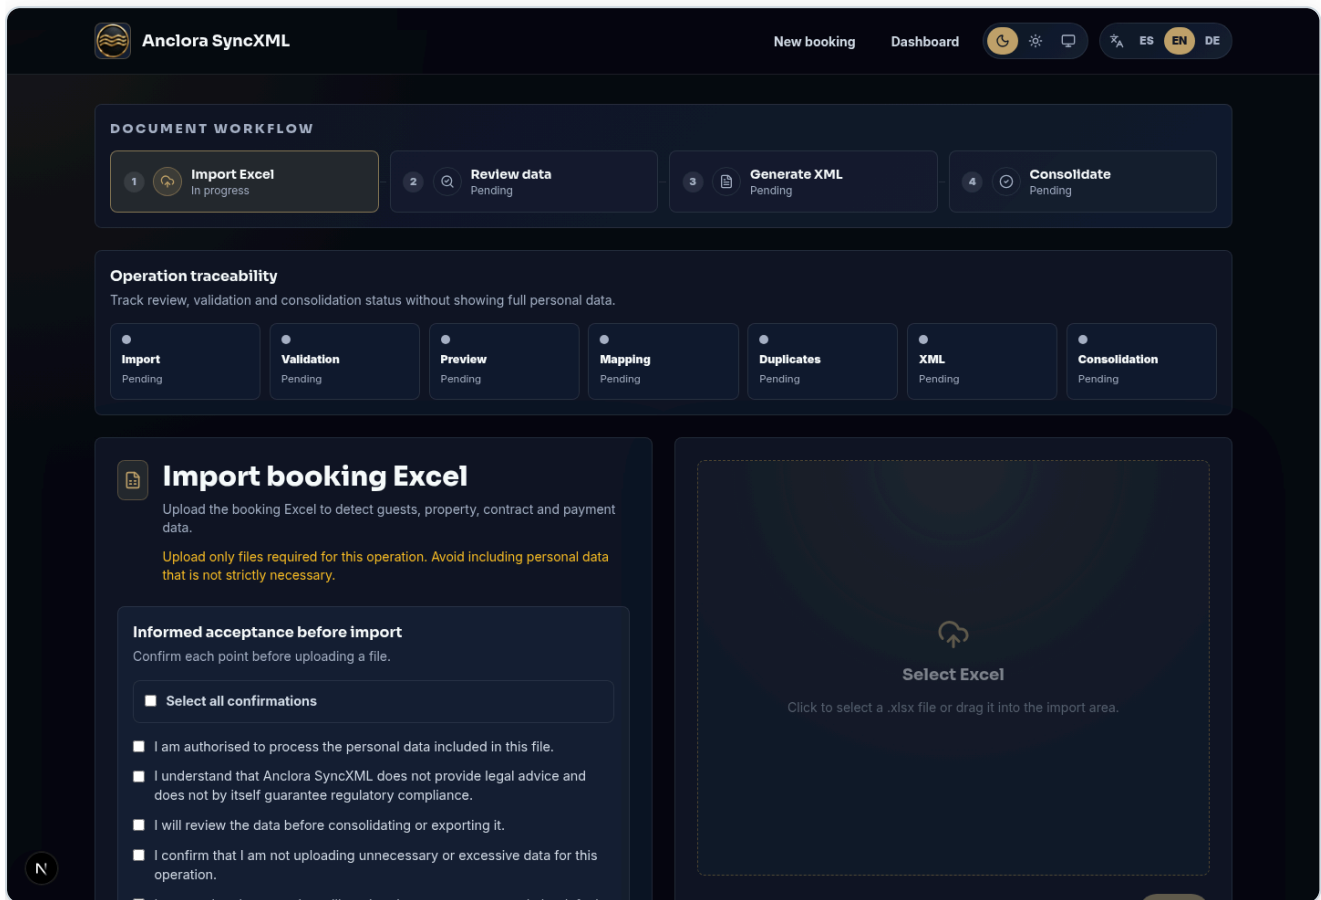

You need

- Booking Excel file in `.xlsx` format.
- Authorisation to process the personal data included in the file.
- Property data and establishment code if the booking will be communicated to SES.
- Complete traveller data: document, birth date, nationality, address, contact and relationship.
- Internal criteria for who reviews and approves the XML before official use.

Recommendations

Topic	Recommendation
Environment	Work on a private screen and avoid exposing unnecessary personal data.
File	Upload only the Excel needed for the operation.
Review	Do not download or consolidate if critical errors remain.
SES	Use pre-production first and keep acceptance/rejection evidence.
Pre-check-in	In tests, use temporary links and avoid real data unless authorised.

3. Document workflow

Import workflow in English

The main workflow has four visible phases:

Phase	Goal
Import Excel	Select the file and accept the informed confirmations.
Review data	Check travellers, booking, contract and validations.
Generate XML	Create the XML and review it visually.
Consolidate	Save the operation in the configured mode and allow later download.

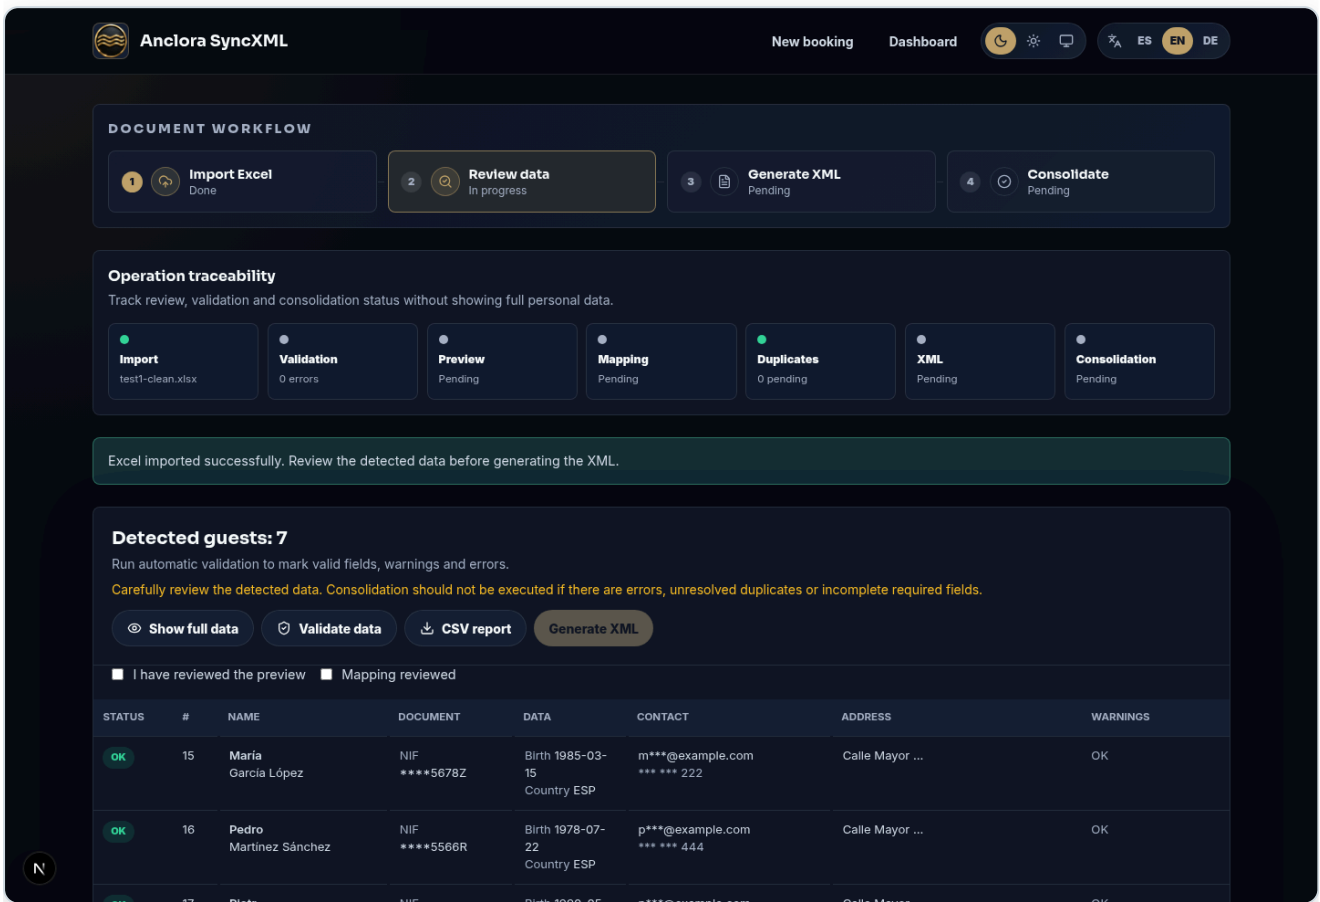

The **operation traceability** band shows import, validation, preview, mapping, duplicates, XML and consolidation status without exposing full personal data.

Import an Excel file

1. Review the informed confirmations.
2. Tick **Select all confirmations** or each checkbox individually.
3. Select the `.xlsx` file.
4. Click **Import**.

If the file is invalid, empty, too large or unreadable, the application shows an error before continuing.

4. Review and smart validation

Imported data review

The review phase lets you understand what the application has detected before any XML is generated.

Main elements

Element	Use
Guest table	Review name, document, nationality, contact and validation status.
Show full data	Reveals unmasked data only when you are in a private environment.
Validate data	Runs smart validation.
CSV report	Downloads an issue and status report by booking and traveller.
Guided review	Completes mandatory SES fields or corrects warnings.
Duplicates	Decide whether to skip, keep or manually review suspicious records.

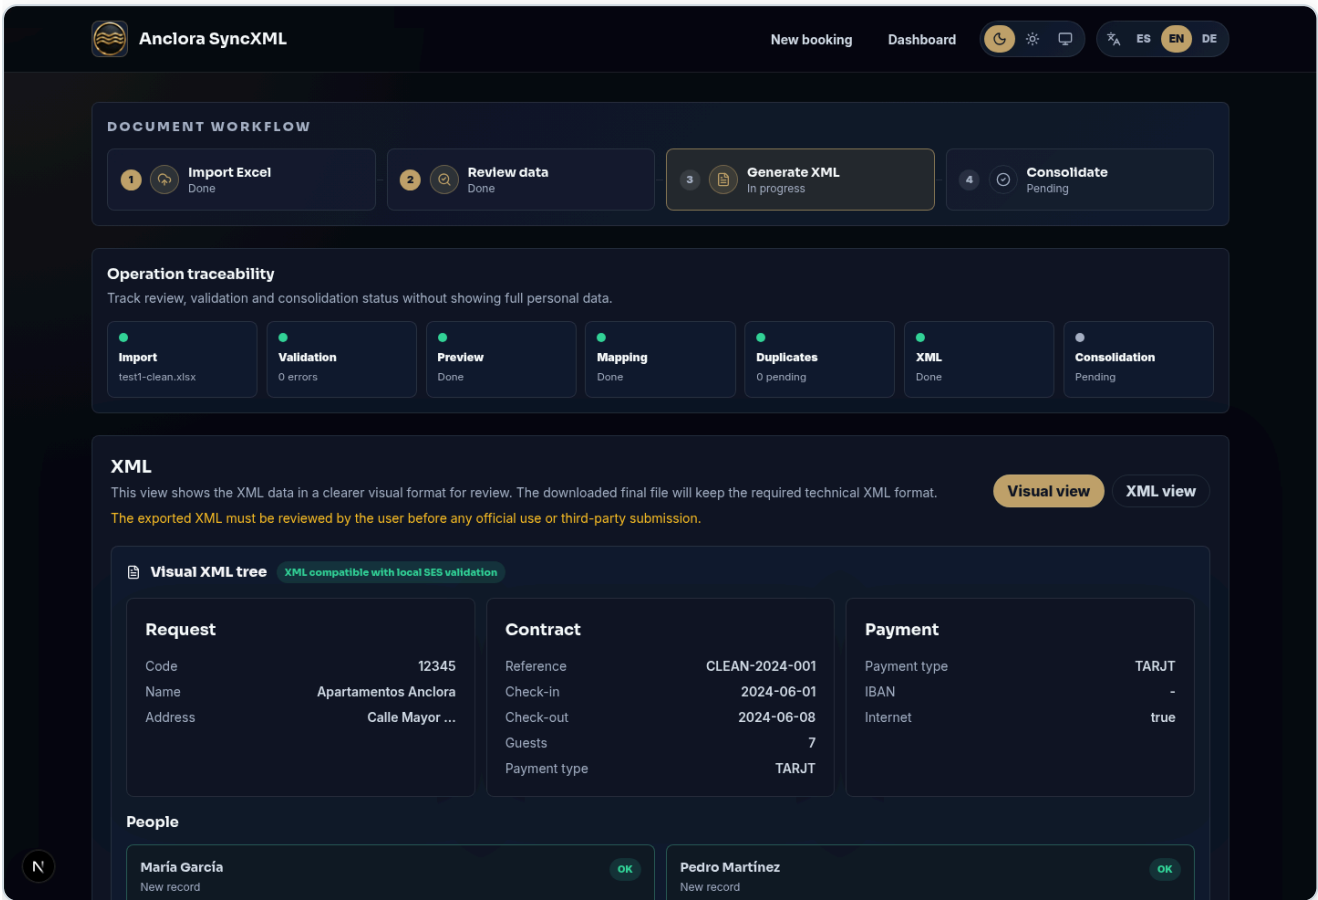

Validation colours

Status	Meaning
Valid	Field is correct or sufficient for the current flow.
Warning	Should be reviewed, but may not block the XML.
Error	Blocks generation, download or consolidation until fixed.

Fields that often need review

- INE municipality code for Spanish addresses.
- Document support for NIF/NIE.
- Sex and relationship.
- Phone or email contact.
- Second surname where applicable.
- Postal code and address.

5. XML generation, review and download

Generated XML visual view

Once critical errors are fixed, click **Generate XML**. The application creates a visual view and a technical view.

Visual view

The visual view organises the XML into blocks:

Block	Content
Request	Establishment code, name and address.
Contract	Reference, check-in, check-out, people and payment.
Payment	Payment type, masked IBAN and internet flag.
People	Included travellers, masked document and contact.

XML view

The XML view shows the technical content that will be downloaded. It must be reviewed before official use.

XML download

The downloaded filename uses this format:

`syncxml-bookingNumber-DDMMYYHH24MISS.xml`

Download is blocked if critical XML issues remain.

6. SES services and test pre-check-in

The screenshot displays the Anclora SyncXML web application interface. At the top, there's a navigation bar with the logo, 'New booking', 'Dashboard', and language selectors (ES, EN, DE). The main content area is divided into two columns. The left column contains buttons for 'Validate SES XML', 'Prepare simulation', and 'Send to pre-production'. The right column has input fields for 'BATCH CODE' (Batch) and 'COMMUNICATION CODE' (Code), a 'CATALOGUE' dropdown menu, and buttons for 'Query batch', 'Query communication', 'Query catalogue', and 'Cancel batch'. Below these, a disclaimer states: 'The application only shows summarised operational results to minimise personal data on screen. Full SES responses must not be stored unless expressly approved.' The 'Test pre-check-in' section, marked as 'Test mode', explains the purpose of the link and provides instructions for 'Guest link' (Create link, Copy link) and 'Minimal retention' (SES remains the official source). The 'Private no-storage mode' section indicates that private mode is active and provides a 'Clear data from this operation' button. The footer shows 'Anclora SyncXML · Private no-storage mode' and links for 'Privacy' and 'Terms'.

SES and test pre-check-in panel

SyncXML includes an assisted SES services panel:

Action	Description
Validate SES XML	Runs local validation against implemented SES rules.
Prepare simulation	Prepares a request without sending data to the Ministry.
Send to pre-production	Available only when credentials are configured.
Query lot/communication	Requires pre-production credentials.
Query catalogue	Lets you inspect official catalogues when SES is configured.

Production remains blocked until controlled testing is complete.

Test pre-check-in

Test pre-check-in DRAFT

Apartamentos Anclora · Reference CLEAN-2024-001
2024-06-01 - 2024-06-08

The data is used only to prepare SES review and communication. SES will be the official source. No document images or complete legal registry are stored in SyncXML.

Traveller 1

NAME	FIRST SURNAME	SECOND SURNAME
María	García	López
DOCUMENT	DOCUMENT NUMBER	DOCUMENT SUPPORT
NIF		
BIRTH DATE	NATIONALITY ISO3	SEX
mm/dd/yyyy	ESP	H
ADDRESS	MUNICIPALITY	MUNICIPALITY CODE
POSTAL CODE	COUNTRY ISO3	RELATIONSHIP
	ESP	TI
PHONE	EMAIL	

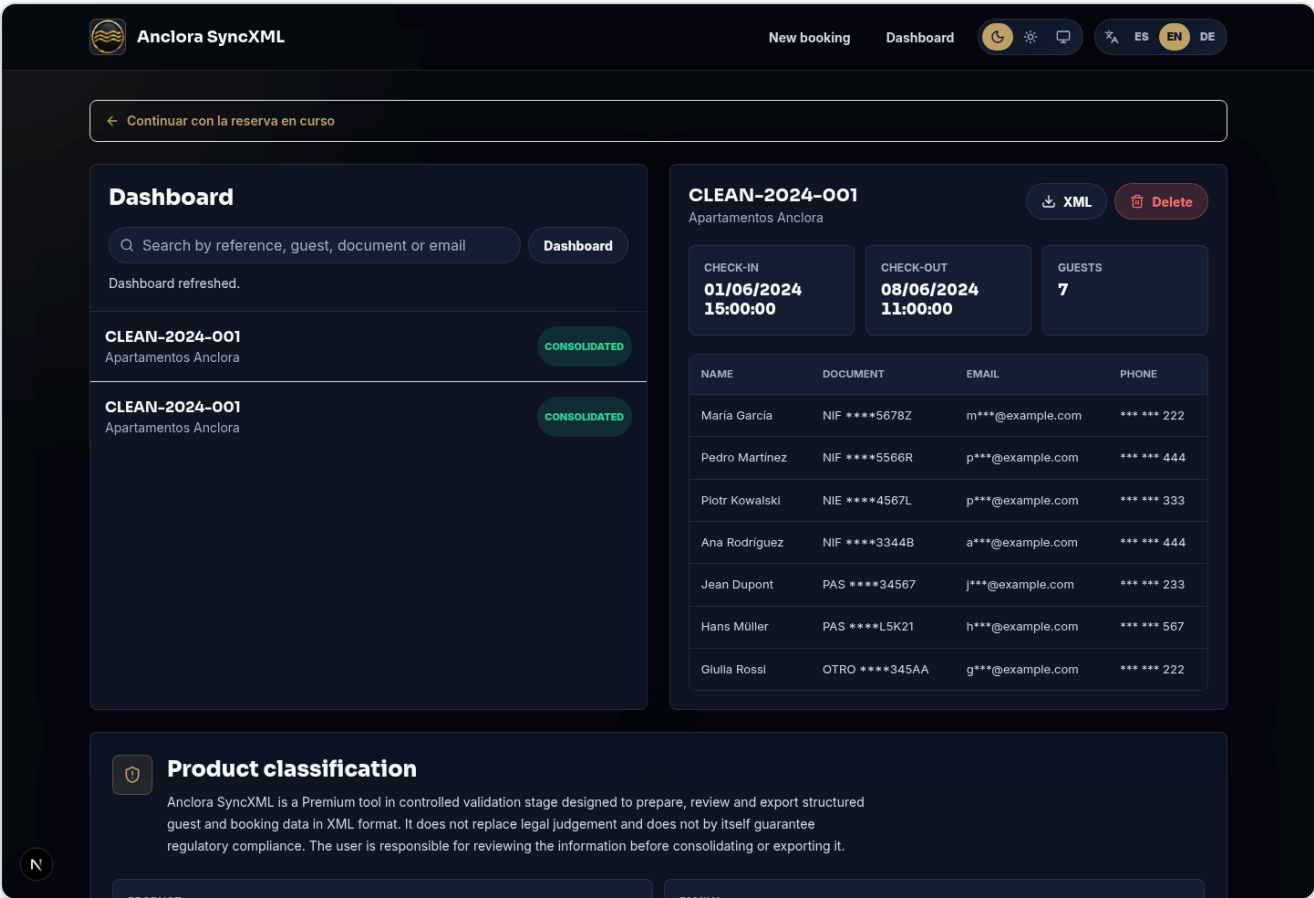

Public pre-check-in form

The test pre-check-in panel creates a temporary link to complete traveller data before review.

In this mode:

- The link is temporary.
- No document images are stored.
- No complete legal registry is created.
- Only operational metadata is kept: token, reference, status, hash and dates.
- SES remains the official source when the real communication is performed.

7. Dashboard and operational history

Dashboard with consolidated booking

The dashboard lets you search bookings, review status and download XML again when the configured storage mode allows it.

Main cards

Card	Information
Booking list	Reference, property and status.
Detail	Check-in, check-out, people and detected travellers.
Actions	Download XML or delete the booking.
Product classification	Reminder of product scope and usage limits.

Dates

Dates are displayed as `DD/MM/YYYY`. If a time exists, they are displayed as `DD/MM/YYYY HH:MM:SS`.

8. Privacy, security and good practices

SyncXML handles personal information. Use these operational rules:

Rule	Reason
Minimise data	Upload only what is needed for the communication.
Review before export	Avoid errors before official use.
Do not store images	ID card/passport images must not be stored in SyncXML.
Use pre-production	Test SES before any real operation.
Clear temporary operations	Use the clear button when a review is finished.
Control access	Only authorised users should open bookings with PII.

SyncXML does not provide legal advice. The controller must approve privacy, DPA, retention and operating procedure.

9. Frequently asked questions

Can I generate XML with errors?

No. Critical errors block generation, download or consolidation until they are fixed.

What happens if the municipality code is missing?

For Spanish addresses, SES requires the INE municipality code. Guided review lets you complete it.

Can I submit to SES from the application?

In pre-production, once credentials and configuration are available. Production remains blocked by default.

Is pre-check-in production-ready?

No. It is implemented in test mode to validate the flow before using real data or enabling persistence.

Are scanned documents stored?

No. The current policy blocks ID card and passport images.

10. Quick glossary

Term	Meaning
SES	Official system used for hospitality communications.
XML	Structured file containing booking and traveller data.
Pre-production	Test environment before production.
Hash	Technical fingerprint used to identify a submission without storing all content.
DPA	Data processing agreement.
PII	Personally identifiable information.
INE	Spanish National Statistics Institute; source for municipality codes.
